

Simon Taylor

My career history focuses on developing global supply chains, procurement, logistics, analysis, optimisation.

Data is my primary tool. Over the last decade I have mastered data control; capture, processing, storage, querying, visualisation. Turning 1s and 0s into Yeses and Noes, dos and don'ts.

Starting with basic excel tables, I'm now systemising data capture, processing and control and pushing data through Python, PowerBI and AI tooling to aid in multi-million-dollar decision making, I continually push my knowledge further.

Supply chain and data is my domain, excel/Python are my tools, my output; less manual work, less risk, better decisions.

Skills & Technical Expertise

Data: Advanced Excel (XLOOKUP, PowerPivot), Python (Pandas/Polars, PyArrow/Parquet, NumPy), SQL (querying/joins, JDBC/ODBC), PowerQuery (M-code), PowerBI (Modelling, DAX, drill-through), AI: OCR/Vision Models (Tesseract/Florence2), LLM (Llama, RAG Qwen), API integration, HTML (CSS, Interactive knowledge, flowcharts, reports)

Supply Chain: Demand Planning/S&OP, Sourcing/Procurement, Inventory Control (Aging, Obsolescence, Positioning, Cycle Counting), Warehouse Design (Racking, Binning, Barcoding), Analysis (ABC/XYZ/FSN, Trend/Velocity, Risk Detection, OTIF), Item/Material Control (Data Capture, BoMs, Lifecycle Management)

Systems: ERP (NetSuite, Navision), WMS (inFlow, RFSmart), CRM (Dynamics)

Compliance: ISO9001 (Quality Management), Data Governance (Definition, Monitoring, Reporting)

Management: Direct Leadership, Indirect Leadership (Cross-country/continent)

Notable Projects:

MRP System:

2026, Bibliotheca

At the request of the CPO, I designed, built and implemented a Materials Requirement Planning system. This system was built using ODBC to perform SQL queries of the ERP database, Python to process queried data and PowerBI to output visualisations of the processed data.

The system was hands-off, meaning full pipeline automation, enabling the end-user to review prepared insights without effort. It was able to process sales orders and pipeline data, current inventory position, future inventory position (calculated goods in/out), evaluate multi-level BoM explosion, then apply allocation rules to determine fulfilment or find stock-out risks and generate advised order quantities and timings. Additionally, based on adjustable criteria, it would flag live orders which were non-compliant, automatically issuing alerts for specific issues.

The initial build took one month, followed by three months of fine tuning with the procurement team and CPO. At this point it was in full production and used on an on-going basis as part of the S&OP cycle.

autoLabel & autoInventory:

2025, Bibliotheca

My own initiative, I reduced friction and risk by reducing user input and expanding functionality of an existing platform.

Using Python and SQL, I was able to interrogate the WMS being used within the warehouse to enable live monitoring of all transaction and item data. This monitoring served two primary goals:

autoLabel; automatically generate and print documents, namely:

- 1) Item labels, when goods were being brought in or moved between locations, a SATO CL4NX printer would print item labels, detailing the condition of the goods, the location they're allocated to and materials information.
- 2) Error alerts, the WMS lacked safeguards allowing for inventory discrepancies. I programmatically created these safeguards. An error 'receipt' is now printed for the operator, detailing the nature and resolution of the issue detected. This immediately increased in inventory accuracy up to a 98% accuracy rate over a 90-day rolling period.

autoInventory; build cycle count sheets, process count inputs, prepare data for import, report on performance.

Using ABC/XYZ/FSN analysis, this program generates the weekly cycle count sheets, prioritising fast moving/high volume goods, whilst ensuring that slower moving goods are not overlooked. The program maintains a memory of past counts, ensuring compliant cycles as well as increasing count frequency for items with higher rates of historic discrepancies.

The cycle counts would be provided to the operator in receipt format, the operator would use a wireless scanner to scan the item labels into my program. The program would then run analysis and processing, errors or discrepancies detected would be reported back to the operator for rectification. Once finalised, the count was pushed back into the WMS database directly, whilst also updating the inventory performance report which this tool generated, ensuring stakeholders were kept informed of performance.

ISO9001 Accreditation:

2016-2026, *Bibliotheca*

ISO9001 accreditation is a mandatory requirement of Bibliotheca's customers since 2016. I built processes to meet this standard along with documentation covering all inventory handling, logistics and non-compliance handling.

After initial completion, I maintained this document suite, ensuring it remained up to date with changes in process, and kept in alignment with the wider organisations processes.

For the 2026 ISO audit, I fully rebuilt the document suite to improve accessibility and expand the scope from what *had* to be covered to what *should* be covered. At the point of audit, there were 19 documents with 40k+ words between them, from high level flowchart overviews down to specific user inputs and actions required to enable repeatable high-quality output.

The result of the 2026 audit was a pass for the UK business, my documentation specifically received zero nonconformances and a commendation from the auditor for effective control of inventory and data management.

Professional Experience

Global Service Inventory Planning

2020–Present, *Bibliotheca*, global scope (21 countries, 30k+ customers), demand planning and inventory control of service stock. Owning the data, ERP systems, and driving procurement, positioning, and financial control.

Data lead in companywide PLM process, providing end-of-life presentations to executive team on topics covering inventory usage and risk to customer deployments and revenues. Required continual, automatic, analysis of 19,000+ SKUs and 200,000+ customer assets and contracts to find risk and identify mitigations.

Produced PowerBI dashboards enabling inventory and OTIF performance reporting for the executive level (high-level, visual heavy) to front-line commercial teams (low level, qualitative)

Ran inventory reviews, identifying excess/obsolete inventory. 2025, disposed of \$1m excess and obsolete stock, globally, removing nearly \$100k per year in warehousing costs.

Site Manager: Titan House

2020–Present, *Bibliotheca*, facility management, vendor management, inventory control/infrastructure, welfare and regulatory compliance.

In 2020, I led on moving existing warehouse from a back-office to industrial premises. I reviewed and selected property, planned and acted on movement of goods/systems, setup the warehouse and took on-going ownership of site management.

This required building new systems of inventory control: bin/location system, FIFO pick discipline, barcoding, and stock quarantine policies. Design and implementation of health and safety policies.

The warehouse space was additionally occupied by three other teams within the organisation, requiring me to balance the needs of multiple teams with conflicting interests to ensure the optimal outcomes.

Upon the completion, floorspace capacity was 5x higher and 66% cheaper per square foot than previous site.

The additional space provided ample opportunities for expansion of services my team offered, I set up an EMEA training facility, built and operated a photo-booth to capture images within our ERP system to aid in item identification to in-house product fabrication and modification (product assembly, CAD and 3D printing, reprogramming/imaging).

Workshop Manager / Engineer / Technician et al

2012–2020, *Bibliotheca*, progressive operational roles, entry level to initial people management, condensed section covers multiple titles

RFID label production (print/program, annual 6 million tags+). Hands-on equipment assessment/refurbishment. Logistics demands, pick/pack/ship. Developed foundational understanding of parts lifecycle, supplier processes, and warehouse operations. Initial management role (2019) spanning inventory, people (two direct reports), and process. Implemented the service-inventory WMS to control stock. Improved same-day part availability from 67% (2016) to 97% (2019).

CERTIFICATIONS & EDUCATION

APICS Certified Supply Chain Professional (CSCP) **2026**

CMILT Chartered Member **2025**

IBM Python for Data Science, AI & Development Certificate **2024**

Google Data Analytics Professional Certificate **2023**

A Level: Computer Science, Applied ICT, Geography **2012**

GCSE: English Language/Literature, Maths, OCR Level 2 ICT, Science & Additional Science, History, Geography, Product Design **2010**

Personal Note

Self-driven problem solver who pursues technically demanding projects beyond the day job. In my private life, I continue learning constantly. At present, primarily with AI, understanding local models and use cases, such as the automatic receipt processing system I have built using AI vision, python and PowerBI to accurately help track my home finances. Beyond data, I am passionately creative, always building, be it woodworking, metalworking, electronics design, and software development.
